Quality report: EUDR supplier geometry validator

Input file	synthetic_planilla_proveedores.xlsx
Generated	2026-10-22 11:14
Commodity	Wood (Southern Cone)
Reference format	EUDR GeoJSON File Description v1.5 (Regulation 2024/3084)

Executive summary

Metric	Value
Parcels evaluated	15
Parcels ready to submit as-is	7
Parcels with blocking error	8
Blocking errors (total)	7
Warnings (non-blocking)	6
Conversion notes	6

What "ready" means: the parcel has no finding of severity Blocking error. The output GeoJSON contains only the ready parcels.

Blocking errors (7)

Parcel	Code	Detail
MSNS-011-INVALIDISO	COUNTRY_INVALID_ISO	'ZZ' is not a valid ISO 3166-1 alpha-2 code. EUDR GeoJSON File Description v1.5
MSNS-006-LATLONSWAP	COUNTRY_MISMATCH	ProducerCountry='AR' does not match the actual location of the geometry (the parcel centroid falls outside the declared country, even with a tolerance margin). EUDR GeoJSON File Description v1.5
MSNS-014-SELFINTERSECT	GEOM_SELF_INTERSECTION	The vertex sequence produces an invalid geometry (self-intersecting, figure-eight shape). Check the vertex order. EUDR GeoJSON File Description v1.5
MSNS-003-MISSINGLATLON	ING_MISSING_LATLON	Latitude or Longitude is missing. Product 1: tabular input schema
MSNS-004-TWOVERTICES	ING_TWO_VERTICES	The parcel has exactly 2 vertex rows: not enough for a polygon (minimum 3 distinct vertices) and not a single point. Check whether a vertex is missing or one was declared too many. Product 1: tabular input schema
MSNS-010-OVERLAP-A / MSNS-010-OVERLAP-B	PARCELS_OVERLAP	Parcel 'MSNS-010-OVERLAP-A' overlaps with 'MSNS-010-OVERLAP-B' by 7.170 ha. EUDR GeoJSON File Description v1.5
MSNS-008-4HAVIOLATION	RULE_4HA_VIOLATION	Declared Area = 8.0 ha (> 4 ha) but the geometry is a Point. Parcels larger than 4 ha must be declared as a polygon, with enough vertices to describe the perimeter. Regulation (EU) 2023/1115, Art. 9

Warnings (6)

Parcel	Code	Detail
MSNS-013-AREAMISMATCH	AREA_MISMATCH	The computed area of the geometry (14.94 ha) exceeds 4 ha but the declared Area (1.5 ha) does not. Check which of the two values is correct. EUDR GeoJSON File Description v1.5
MSNS-007-PRECISION	COORD_PRECISION	The longitude has 14 decimal places (recommended maximum: 6). More than 6 decimals can produce duplicate coordinates through rounding when processed by the system. EUDR GeoJSON File Description v1.5
MSNS-007-PRECISION	COORD_PRECISION	The latitude has 14 decimal places (recommended maximum: 6). More than 6 decimals can produce duplicate coordinates through rounding when processed by the system. EUDR GeoJSON File Description v1.5
MSNS-005-INCONSISTENT	ING_METADATA_INCONSISTENT	The property 'ProducerCountry' has different values across rows of the same parcel (['AR', 'BR']); the first one was used. Product 1: metadata consistency per ParcelID
MSNS-009-NOAREA	POINT_NO_AREA	The parcel is a Point with no declared Area. The Information System will assume 4 ha by default, a silent risk if the real parcel is larger or smaller. EUDR GeoJSON File Description v1.5

Parcel	Code	Detail
MSNS-012-NOSPECIES	SPECIES_MISSING	Missing: CommonName, ScientificName. For wood, the due diligence statement requires the common name and full scientific name of the species. Implementing Regulation (EU) 2024/3084, Art. 4

Conversion notes (6)

Parcel	Code	Detail
MSNS-002	ING_AUTOCLOSE	The polygon was closed automatically by repeating the first vertex at the end (the source file did not repeat it, which is common practice in spreadsheets). Product 1: tabular to GeoJSON conversion
MSNS-005-INCONSISTENT	ING_AUTOCLOSE	The polygon was closed automatically by repeating the first vertex at the end (the source file did not repeat it, which is common practice in spreadsheets). Product 1: tabular to GeoJSON conversion
MSNS-010-OVERLAP-A	ING_AUTOCLOSE	The polygon was closed automatically by repeating the first vertex at the end (the source file did not repeat it, which is common practice in spreadsheets). Product 1: tabular to GeoJSON conversion
MSNS-010-OVERLAP-B	ING_AUTOCLOSE	The polygon was closed automatically by repeating the first vertex at the end (the source file did not repeat it, which is common practice in spreadsheets). Product 1: tabular to GeoJSON conversion
MSNS-013-AREAMISMATCH	ING_AUTOCLOSE	The polygon was closed automatically by repeating the first vertex at the end (the source file did not repeat it, which is common practice in spreadsheets). Product 1: tabular to GeoJSON conversion
MSNS-014-SELFINTERSECT	ING_AUTOCLOSE	The polygon was closed automatically by repeating the first vertex at the end (the source file did not repeat it, which is common practice in spreadsheets). Product 1: tabular to GeoJSON conversion
